```

Moyenne pondérée par effectif, par académie¶

In [3]:

```
df.groupby('academie').apply(lambda x: np.average(x['ips'], weights=x['effectifs'])).sort_values
```

Out[3]:

```
<Axes: ylabel='academie'>
```

Moyenne par département dans l'académie de Rennes¶

In [4]:

```
df_rennes = df[df['academie'] == 'RENNES']
```

In [5]:

```
ax = (
    df_rennes
    .groupby('departement')
    .apply(lambda x: np.average(x['ips'], weights=x['effectifs']))
    .sort_values()
    .plot(kind='barh')
)
for container in ax.containers:
    ax.bar_label(container, fmt='%.2f')
```

Par commune, dans le Morbihan¶

In [6]:

```
df_morbihan = df[df['departement'] == 'MORBIHAN']
```

In [7]:

```
df_morbihan.groupby('nom_de_la_commune')['effectifs'].sum().sort_values()
```

Out[7]:

```
